

Course “Object-Oriented Programming in C++”**Week №14*****Homework*****Exercise 1.**

Add the exception handling mechanism to the class of doubly linked list. Generate the exceptions in the case of errors according to your choice. For example, lack of memory, attempt to remove from the empty list, etc.

Exercise 2.

Create a hierarchy of user's exception classes. It should encompass classes for different situations. Use your practical exercises and homework as a data domain. For example, classes for the processing of various mathematical errors should be included, lack of memory, problems at work with files, etc.

Exercise 3.

Within previous independent work and homework you have created a set of classes for working with a variety of primitive mathematical operations (a fraction, a point in two-dimensional space, a point in three-dimensional space, etc.). Place already created classes in namespaces. Think over the correct structure of the created spaces. Using the mechanism of spaces, write code to test the obtained solution.
