

Course “Object-Oriented Programming in C++”**Week №17*****Homework*****Exercise 1.**

Create an application for the auto showroom. It is necessary to store the information about selling cars (name, year of manufacture, engine size, price). Implement the interface for adding data, deleting data, data displaying, data sorting by various parameters, searching for data by various parameters. When implementing use containers, functors and algorithms.

Exercise 2.

The set of integers is stored in the container of the type vector. Create functors for the solution of the following problems:

1. Search for the minimum value
2. Search for the maximum value
3. Data sort descending
4. Data sort ascending
5. Increase values by a specified constant in the container
6. Reduced values by a specified constant in the container
7. Remove elements which are equal to sought-for value from the container

Do not forget to use algorithms where it is necessary.

Exercise 3.

Convert functors from the first exercise into template classes — functors. Check the obtained solution on different containers with different contents.
